## ART OF MAKING ICE CREAM

Naturals ice cream is loved across the country. A cup of Naturals ice cream is usually devoured in no time at all. This is in stark contrast to the process that we follow to make our ice cream. It's slow and unhurried. The original taste of our ice creams is precisely due to the small batches in which they are made and the time we allow them to be created in. While we have continued to grow, we still make our ice creams with a lot of love, care and TIME. And originality of course!

We are Committed to Driving Racial Equity Throughout Our Business. We are a company deeply committed to racial equity, and we aim to have a workforce and franchise. We used to be an aspiring social justice company. We are focused on positive outcomes for all people of color.

## **Create a website -**

We have created our website using HTML and CSS, where HTML (Hypertext Markup Language) is used to create the structure and content of web pages and CSS (Cascading Style Sheets) is used to style and layout web pages, controlling elements like colors, fonts, spacing, and positioning.

To create a website using HTML, start with a basic HTML structure in a text editor like Notepad or a more advanced code editor.

Save the file with a html extension (e.g., project.html) and then open it in your browser. You can then add content, structure, and styling using HTML and CSS, respectively.

We have created a website of Ice Cream brand named as **“Scoop Ice Cream”**. In this website, we have created 4 web pages and connected them through hyperlink.

These web pages are-

- **Home**
- **Ice Creams**
- **About Us**
- **Contact Us**

# **Tags and Attributes used to create a Website-**

## **1. Basic HTML Structure:**

- **<!DOCTYPE html>:** Declares the document type as HTML5.
- **<Html>:** The root element of the page.
- **<Head>:** Contains meta-information, such as the title and character set.
- **<Title>:** Specifies the title of the page, which appears in the browser's title bar.
- **<Body>:** Contains the visible page content.

## **2. Adding Content:**

- Use HTML elements like **<p>** for paragraphs, **<h1>-<h6>** for headings, **<a>** for links, and **<img>** for images.
- You can use **<br>** tag for line break, **<hr>** tag for horizontal rule, **<center>** tag for text align in center and **<div>** tag for division.
- You can also use elements like **<form>** for input fields and **<button>** to create a clickable button within a web page.

### **3. Styling with CSS:**

CSS (Cascading Style Sheets) controls the layout and visual presentation of your website. You can link a separate CSS file (`<link rel="stylesheet" href="style.css">` in the `<head>`) or write CSS directly within the `<style>` tag.

`<Style>` attribute contain many features like-

- Color
- Background color
- Text align
- Padding
- Font size

### **4. Connecting web pages through Hyperlink:**

- In HTML, `<a>` tag defines hyperlink which is used to link one page to another.
- Inside of `<a>` tag, `href` attribute is used to specify the URL of the page that is connected in our link.

## Adding images in website,

- We have to create a folder named as “Minor Project” as shown below.
- Then save our coding in the same folder and download images in it that we want to insert in the website.
- Now, open the coding of webpage in which we are inserting images and use `<img src= “-”>` tag where image location is written inside src attribute in image tag.
- (i.e., image\_name .jpeg)
- In the same way add all the images that we want to insert in our website at their specified location.
